

Master List of Formulas and Symbology Descriptions

Disclaimer: Here are some common formulas; however this is not an exhaustive list and you may not need all of them.

Video Camera Image Size

$$IS = 2 * D * \tan\left(\frac{A}{2}\right)$$

Where *IS* is the image size
D is the distance from the lens to the subject
A is the lens angle of view

Projector Lumens Output

$$Brightness = \frac{\left(\frac{L * C * A}{Sg}\right)}{Dr}$$

Where *L* is ambient light at screen location*
C is the desired contrast ratio
 7:1 – Passive Viewing – television
 15:1 – Basic Decision Making Presentations
 50:1 – Analytical Decision Making – Art work, Medical
 80:1 – Full Motion Video – Home Theater
A is the area of screen **
Sg is the gain of the screen. Assume a screen gain of 1 unless otherwise noted.
Dr is the projector derating value. Assume a derating value of 0.75 unless otherwise noted.

* Light units are in either lux or footcandles
 ** area in square meters or square feet

Loudspeaker Coverage Pattern (Ceiling Mounted)

$$D = 2 * (H - h) * \tan\left(\frac{C_z}{2}\right)$$

Where *D* is diameter of coverage circle at ear height
H is overall ceiling height
h is height of the listener's ears (48 inches)
C_z is off-axis coverage angle of polar pattern

Loudspeaker Spacing (Ceiling Mounted)

$$D = 2 * r \quad \text{(Edge-to-edge)}$$

$$D = r * \sqrt{2} \quad \text{(Minimum overlap)}$$

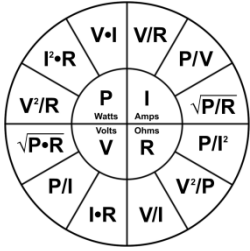

$$D = r \quad \text{(Center-to-center)}$$

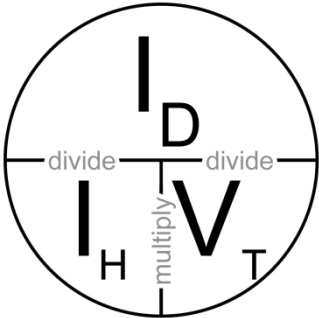

Where *D* is the distance between loudspeakers
r is the radius of loudspeaker coverage circle

Wattage at the Loudspeaker

$$EPR = 10^{\left(\frac{L_p + H - L_s + 20 \log\left(\frac{D_2}{D_r}\right)}{10}\right)} * W_{ref}$$

Where *EPR* is electrical power required at loudspeaker
L_p is SPL required at distance *D₂*
H is required headroom
L_s is loudspeaker sensitivity at 3.28 feet (1 m)
D₂ is distance from loudspeaker to listener
D_r is distance reference value
W_{ref} is the wattage reference value. Assume a wattage reference value of 1 unless otherwise noted.

<p>Loudspeaker Impedance</p> $Z_T = \frac{1}{\frac{1}{Z_1} + \frac{1}{Z_2} + \frac{1}{Z_3} \dots \frac{1}{Z_N}}$ $Z_T = \frac{Z_1}{N}$ <p>Where Z_T is the total impedance of the loudspeaker system Z_1 is the measured impedance of a loudspeaker N is the quantity of loudspeakers in the circuit</p>	<p>Ohm's Law Related</p> $I = \frac{P}{V}$ <p>Where I is current V is circuit voltage P is power *</p>  <p>* Look up amplifier power in owner's manual before adding to the other AV devices.</p>
<p>Needed Acoustic Gain</p> $NAG = 20 \log \left(\frac{D_0}{EAD} \right)$ <p>Where NAG is Needed Acoustic Gain D_0 is distance from source to listener EAD is Equivalent Acoustic Distance</p>	<p>Potential Acoustic Gain</p> $PAG = 20 \log \left(\frac{D_0 * D_1}{D_2 * D_s} \right)$ <p>Where PAG is Potential Acoustic Gain D_0 is distance from source to listener D_1 is distance from loudspeaker to mic D_2 is distance from loudspeaker to listener D_s is distance from source to microphone</p>
<p>Audio System Stability (PAG NAG Complete Formula)</p> $20 \log_{10} \left(\frac{D_0}{EAD} \right) < 20 \log_{10} \left(\frac{D_0 D_1}{D_2 D_s} \right) - 10 \log_{10}(NOM) - FSM$ <p>Where NOM = Number of Open Microphones FSM = Feedback Stability Margin EAD = Equivalent Acoustic Distance D_0 = the distance between the talker and the farthest listener D_1 = the distance between the closest loudspeaker to the microphone and the microphone D_2 = the distance between the loudspeaker closest to the farthest listener and the farthest listener D_s = the distance between the sound source (talker) and the microphone</p>	
<p>Power Amplifier Wattage (Constant Voltage)</p> $W_t = W * N * 1.5$ <p>Where W_t is required wattage W is watt tap used at individual loudspeaker N is total number of loudspeakers 1.5 is 50 percent amplifier headroom</p>	<p>Power Amplifier Heat Load</p> $Total\ BTU = W * 3.4 * (1 - E_D)$ <p>Where $Total\ BTU$ is the total British Thermal Units released W is the wattage of the amplifier E_D is the efficiency of the device</p>

<p>Heat Load</p> $Total\ BTU = W_E * 3.4$ <p>Where <i>Total BTU</i> is the total British Thermal Units released <i>W_E</i> is the total watts of equipment in the room</p>	<p>Jam Ratio</p> $JAM = \frac{ID}{\left(\frac{OD_1 + OD_2 + OD_3}{3}\right)}$ <p>Where ID is the inner diameter of the conduit OD is the outer diameter of each conductor</p>
<p>Conduit Capacity</p> <p>Where <i>ID</i> is the inner diameter of the conduit <i>OD</i> is outer diameter of each conductor</p>	$ID > \sqrt{\frac{OD^2}{0.53}} \quad \text{One Cable}$ $ID > \sqrt{\frac{OD^2 + OD^2}{0.31}} \quad \text{Two Cables}$ $ID > \sqrt{\frac{OD^2 + OD^2 + OD^2 \dots}{0.40}} \quad \text{3+ Cables}$
<p>Image Height to Farthest Viewer Distance Ratio</p> $\frac{I_H}{I_D} = \frac{D_T}{V_T}$ <p>The relationship between image height, viewing task, and farthest viewer distance can also be represented as a wheel:</p>  <p>Where <i>I_H</i> = Image height <i>I_D</i> = Distance from the farthest viewer to the image <i>V_T</i> = Viewing Task Ratio: distance 4 for Inspection Viewing Tasks 6 for Reading with Clues Viewing Tasks 8 for General Viewing Tasks <i>D_T</i> = Viewing task: height ratio. This will be 1.</p>	
<p>Computer Video Signal Bandwidth</p> $HF = \frac{H_{pix} * V_{pix} * f_v}{2} * 3$ <p>Where <i>HF</i> is the highest frequency in Hertz <i>H_{pix}</i> is the total number of horizontal pixels <i>V_{pix}</i> is the total number of vertical pixels <i>f_v</i> is the refresh rate</p>	<p>Minimum Video System Bandwidth</p> $SF = HF * 2$ <p>Where <i>SF</i> is the system frequency in Hertz <i>HF</i> is the highest frequency in Hertz of the computer signal</p>
